Contents

Rambutan is project for open STM32 microcontroller tools, based on Leaflab's libmaple firmware library. These tools and libraries are intended to make it easier to build embedded electronics projects using low-cost, low-power ARM Cortex-M3/M4 family microcontrollers.

Eventually this location will be a catch-all for systems-level integration instructions, tutorials, and example projects, but for now it's simply a (very short) index of sub-project documentation links.

Subproject Documentation

- librambutan - firmware helper libraries in C and C++
